

NEXATM BALANCE

Let Nexa Balance your pool 24 hours a day

The Nexa Balance digital control uses advanced sensor technology to monitor and control pH and chlorine levels automatically and continuously. The pH and ORP sensors sample the water while the digital control displays the information on a large user-friendly display. When incorporated with the Resilience feeding systems, the control can also add the proper amount of acid and chlorine in small precise amounts on a regular basis. This eliminates the fluctuations in chlorine and acid levels normally associated with residential pools.

It also eliminates the need to manually add chlorine or acid to the water. The Nexa Balance synchronizes seamlessly with Resilience, The Natural Chlorine Generator, which is activated by the Nexa Balance whenever more sanitizer is needed in the water.

- Monitors and balances pH and ORP continuously
- Low voltage for simple installation and safety
- Digital system with accurate and reliable readings
